repoPurge

Command Reference

Table of contents

1. Description

Remove package objects from the repository.

Processes results of [repoFind](#) and removes each package from the repository - deleting the file from the webdav and object in the project model.

The `-packagename` and `-packagetype` arguments allow one to filter the repoFind result data, only purging objects matching those patterns.

2. Usage

```
ctl -t Builder -o <objectname> -c repoPurge [-buildertype <>]
[-buildstamp <>] [-ignoreparents <false>] [-packagename <.*>]
[-packagetype <>] [-session <repoFind.session>]
```

2.1. Options

Option	Description	Type	Default
buildertype	*builder type*	string	`${context.type}`
buildstamp	*build identifier (regex allowed)*	string	`${entity.attribute.packagePurg`
ignoreparents	*delete package even if it is associated with a parent resource*	string	`false /` `${entity.attribute.packagePurg`
packagename	*package name*	string	`.*`
packagetype	*type (or subtype) of package to find*	string	`${entity.attribute.packageType`
session	*session results are stored*	string	`repoFind.session`
