Configure

Command Reference

Table of contents

1. Description

Run the configuration cycle for the deployment.

The Configure command manages the configuration phase of the deployment lifecycle and invokes the Docs-Generate to generate any configured template-based documents. The typical usage of Configure, is to customize a Deployment's configuration according to its environmental context after the package installation step has occurred. Subtypes can override the Configure workflow to include additional configuration related commands.

2. Usage

```
ctl -t Deployment -o <objectname> -c Configure
```

2.1. Workflow

1. Docs-Generate
