1. Overview

various WebDAV utilities

1.1. Documentation

Documentation is available on the ControlTier Wiki: [Utility Type Guide - davutil](#)

2. About Commands

2.1. Authentication

To access resources maintained in the WebDAV repository it is often necessary to authenticate first. All the davutil commands support two parameters, `-username` and `-password`, that let you specify the login information. These parameters are not required and actually default to settings in the CTL [[framework.properties]] configuration file:

- `framework.webdav.username`
- `framework.webdav.password`

To specify arbitrary username/password values use the following form:

```
ctl -m davutil -c <command> -- -username user -password pass  
<command-args>
```

2.2. dav:// prefix

The davutil commands all require URL parameters to point to the specific DAV URLs to act upon. All of these parameters allow the `dav://` shortcut schema to be used in place of the full DAV root URL used by the ControlTier webdav server.

For example this URL:

```
http://strongbad:8080/jackrabbit/repository/workbench/junk/fun
```

Can be shortened to:

```
dav://junk/fun
```
