

Get-Process-View

Command Reference

Table of contents

1 Description.....	2
2 Usage.....	2

1. Description

Gets the process view file for the object.

Retrieves the process view xml file.

Access

Managed-Entity includes this base implementation for accessing and storing the process view driven by the following two parameters.

- `entity.processview.file`: This property references the file where process view will be stored. By default it is stored as `${entity.instance.dir}/var/pview.xml`.
- `entity.processview.url`: This property references a URL that can be used to retrieve the file.

The locations for either property above can be modified via the framework configuration file, `${antdepo.base}/etc/entity.properties`.

For efficiency sake, this implementation uses a timestamp check to compare if the `${entity.processview.url}` is newer than `${entity.processview.file}`, and if so, will download a new copy.

Data Format

The process view XML format is used by Jobcenter.

2. Usage

```
ctl -t Managed-Entity -o <objectname> -c Get-Process-View
```
