1. Overview

A simple Builder to interface with Maven

1.1. Intent

Provide a standard interface to automate [Maven](#) integrated builds.

- Automate environment and configuration setup.
- Expose maven options and arguments into the ControlTier object model for automating each build.
- Support automated builds within a Continuous Integration (CI) Loop such as [Hudson](#) or [CruiseControl](#).
- Support additional [Continuous Deployment](#) as part of a CI Loop in order to automate end to end build and deployment within a development environment.

1.2. Problem

Automating builds require command line parameters, environment, supporting infrastructure, and configuration. Setting up an automated build is different than a developer's environment in that pure command line and environment must be explicit and managed for change. Exposing all of these configurations including any referring CI deployed tool must be coherently managed.
