## 1. Overview

*Ant builder with specialized defaults for Tomcat applications*

This type provides the following features over the [AntBuilder](#) type:

- catalinaHome is set as an attribute, with the default being the CATALINA\_HOME environment variable.
- catalinaHome can also be set via the BuilderCatalinaHome setting.
- The catalina.home property is passed to ant by default via the antOpts attribute.
- The default package type is set to war.

Other than these defaults, functionality is identical to [AntBuilder](#).
